This entry proposes a new typology based on the specific qualities of wood constructions and the fascinating qualities of the urban rooftop landscape. The concept of a revolving oval creates a spectacular panoramic view and sunny terrace for all apartments. Two apartments per floor - 70 sqm each - are suited for a growing market of young urban professionals in Rotterdam.

The revolving design can be 3, 5 or 8 stories depending on the specific parameters of the individual site. The design is based on a small range of standardized elements creating new homes fast and affordable but also sustainable and comfortable. The prefabricated wooden elements are used to emphasize the unique qualities of the rooftop urban landscape and the beauty of contemporary wood architecture.
